I have not read all of it yet, but the long chapter called "Objectives, and Mechanics of Competitive Electricity Markets" by Walter Hall et al. is an excellent, thorough, well-written explanation of the complex subject of electric markets. It does a good job explaining FERC Order 2000's

encouraging development of RTOs and also the purposes of RTOs, and types and the distinction between RTOs and ISOs and transcos. This chapter then looks at how the different regions have set up their regulations, markets, and operations. I would recommend this book for anyone who needs to understand the electric grid at a deeper level than Wikipedia can provide. Although it is not written for a general audience, it is completely accessible for anyone with an interest in the power industry.

Lawyers, government officials, academics, and consultants will all benefit from this comprehensive guide to electric restructuring. This book examines some of the most important legal and policy issues associated with electricity law including the following topics: -History, objectives and mechanics of competitive electricity markets -Energy facility siting -Renewable portfolio standards -Efficiency programs for electric customers -Municipal electric aggregation -Competitive retail electricity offers
